## **V. I. T. A. L. Knowledge System™ Unit Logging, Alarm Logging and Tracking and Visual Display**

Antenna Systems & Solutions, Inc. introduces the *V. I. T. A. L. Knowledge System™* that literally means *Visual Identification, Tracking, and Logging Knowledge System*.

The *V.I.T.A.L Knowledge System™* is a hardware and software application that offers a wide variety of solutions to meet your serial data and contact closure monitoring needs.

The system displays all events as they occur and logs them to the hard disk on your computer.

Interfacing is easily accomplished via the use of serial ports installed in your computer and up to eight ports are supported. With additional optional hardware, the system may be expanded to nearly limitless proportions. An easy to use Query is included and allows the user to quickly create specific reports, save them for later use or simply see the results on screen. Monitoring is not interrupted while Query is active.

## **Typical Application Uses**

### **Two-Way Radio Communications**

When teamed up with your 2-way radio system, the console dispatcher will be able to see who is calling on the screen. Radio monitoring assumes the system uses a PTT ID.

### **Alarm Monitoring**

Any type of device capable of producing serial output or contact closure may be monitored. Devices such as medical pendants may be used to create a system for monitoring residents in an assisted living arrangement.

### **RFID Monitoring**

Locate your containers, cartons, products or people with an RFID tag!

In short, if you have ANY device that can send data, it can be monitored. Imagine the possibilities.

## **System Requirements**

PC with Pentium or later processor, 256Mb RAM

Operating System: any version of Windows 98, NT, 2000 or XP

Hard Drive: 40Gb or higher

Serial Port(s): up to 8 ones are supported

Printer (for reports)
